Lab 2: Agile Backlog & Sprint Simulation (Jira) - Podcast Guest Scheduling & Outline Builder

Aryan Upadhyay | SRN: PES1UG25CS806 | Section C | Software Engineering (UE24CS341A)

Jira project: **Podcast-Guest-Scheduler** (key **PGS**), Scrum template, company-managed. The Epics and User Stories below come from the Lab 1 requirements for Problem Statement #60. A ready-to-import file (**jira_import.csv**) with the same items is included in this folder.

1. Epics

Key	Epic	Description	Lab 1 requirements
E1	Epic 1: Host Availability Management	Let show hosts publish recording slots in their time zone and block dates they are unavailable.	FR-002
E2	Epic 2: Guest Booking & Calendar Invites	Let guests book an interview slot through a secure link and get a calendar invite automatically.	FR-001, FR-003, NFR-002
E3	Epic 3: Guest Outline Collection	Collect structured talking points and biography links from guests and organise them on an episode board.	FR-001, FR-004
E4	Epic 4: Run-of-Show Production Notes	Turn the episode board into a timestamped run-of-show and export it as a PDF production sheet.	FR-005, NFR-001

2. User Stories (prioritised backlog)

Epic 1: Host Availability Management

Story	As a	I want to	So that	Priority	Points	Sprint
Story 1.1: Publish Time Slots	As a show host	I want to publish recording slots with date, start time and duration	So that guests can only book times I have offered	High	3	Sprint 1
Story 1.2: Block Dates	As a show host	I want to block dates when I am unavailable	So that no guest can book me on those days	High	2	Sprint 1
Story 1.3: Time-Zone Display	As a podcast guest	I want to see open slots in my own time zone	So that I do not turn up at the wrong hour	Medium	3	Backlog

Epic 2: Guest Booking & Calendar Invites

Story	As a	I want to	So that	Priority	Points	Sprint
Story 2.1: Book Interview Slot	As a podcast guest	I want to pick an open slot from the host's booking page	So that my interview is confirmed without email back-and-forth	Highest	5	Sprint 1
Story 2.2: Calendar Invites	As a podcast guest	I want to receive a calendar invite as soon as I book	So that the recording is in my calendar with the link	High	5	Sprint 1
Story 2.3: Join Waitlist	As a podcast guest	I want to join a waitlist when no slots are open	So that I am told when the host adds new times	Low	3	Backlog
Story 2.4: Secure Booking Links	As a show host	I want booking links to be unguessable and expire after use or 14 days	So that strangers cannot book fake interviews or read guest details	High	3	Sprint 2

Epic 3: Guest Outline Collection

Story	As a	I want to	So that	Priority	Points	Sprint
Story 3.1: Submit Talking Points	As a podcast guest	I want to submit 3-10 bullet-point discussion topics when I book	So that the host knows what I want to talk about	High	3	Sprint 1
Story 3.2: Add Biography Links	As a podcast guest	I want to add links to my bio and past work	So that the host can introduce me properly	Medium	1	Sprint 2
Story 3.3: Episode Board	As a show host	I want to see all guest outlines on one board and reorder topics	So that I can plan the flow of the episode	Medium	5	Sprint 2

Epic 4: Run-of-Show Production Notes

Story	As a	I want to	So that	Priority	Points	Sprint
Story 4.1: Timestamped Run-of-Show	As a show host	I want start times to be calculated from each segment's planned duration	So that I know exactly when each topic starts during recording	High	5	Sprint 2
Story 4.2: PDF Production Sheet	As a show host	I want to export the run-of-show as a PDF in under 1 second	So that I can share it with my producer right before recording	High	3	Sprint 2

3. Story Points (Fibonacci) and Estimation Rationale

Points use the Fibonacci scale (1, 2, 3, 5, 8...) relative to the smallest story (3.2 Add Biography Links = 1). Each story was estimated Planning-Poker style: pick a card for complexity, amount of work and uncertainty, then compare with already-estimated stories before settling on a value.

Story	Points	Why
1.1 Publish Time Slots	3	Simple form + slot table; well understood.
1.2 Block Dates	2	Flag on top of 1.1 plus a booking check.
1.3 Time-Zone Display	3	Time-zone conversion and edge cases (DST).
2.1 Book Interview Slot	5	Slot holds and double-booking race conditions.
2.2 Calendar Invites	5	External calendar API integration; most uncertainty.
2.3 Join Waitlist	3	Notification trigger on new slots.
2.4 Secure Booking Links	3	Token generation, expiry and access checks.
3.1 Submit Talking Points	3	Structured form with validation.
3.2 Add Biography Links	1	Two URL fields with validation.
3.3 Episode Board	5	Drag-and-drop UI plus saving order and history.
4.1 Timestamped Run-of-Show	5	Timing logic and segment model.
4.2 PDF Production Sheet	3	PDF library + performance benchmark.

Total backlog: 41 points.

4. Sprint Plan (1-week sprints)

Sprint	Goal	Stories	Points
PGS Sprint 1	A host can publish slots and a guest can book one, submit talking points and receive a calendar invite.	1.1, 1.2, 2.1, 2.2, 3.1	18
PGS Sprint 2	Secure the booking links, give the host the episode board, and produce the timestamped PDF run-of-show.	2.4, 3.2, 3.3, 4.1, 4.2	17
Backlog	Carried to a later sprint.	1.3, 2.3	6

Workflow for each sprint: start sprint -> move stories To Do -> In Progress -> Done in priority order -> Complete sprint -> check Reports > Burndown Chart.

5. Screenshots

Saved in the **screenshots/** folder: (1) backlog with Epics and User Stories, (2) story point assignments, (3) active sprint board, (4) burndown chart for each sprint.

6. Reflection

1. Did your estimations reflect the actual effort? Mostly. The external calendar integration (2.2, 5 points) and slot booking with holds (2.1, 5 points) carried the most uncertainty and stayed In Progress longest. Small form stories such as 1.2 Block Dates and 3.2 Biography Links moved to Done quickly, matching their 1-2 point estimates. Time-zone handling (1.3) was the story most likely to be underestimated because of daylight-saving edge cases.

2. Was your backlog well-prioritised? Yes. Sprint 1 holds only what is needed for one complete booking: publish slots, block dates, book a slot, submit talking points, and send the invite. The host-side production features (episode board, run-of-show, PDF) and link security followed in Sprint 2, and nice-to-have items (waitlist, time-zone display) stayed in the backlog.

3. How did your simulated sprint align with your plan? Both sprints were completed with all committed stories Done (18 points in Sprint 1, 17 points in Sprint 2). Because the sprint was simulated, stories were moved in priority

order rather than over real working days, so the order of completion matched the plan.

4. What insights did the burndown chart give about your team's capacity? The remaining-work line dropped in steps as each story moved to Done. The 5-point stories caused the biggest single drops, so splitting them (for example, separating slot holds from the booking form) would give a smoother, more predictable burndown. The two sprints suggest a velocity of about 18 points per week, so the remaining 6 points fit easily into Sprint 3.
